

CUE PATCH NOTES

Version 1.13.36 – December 9th 2015

CUE 1.13.36 is the latest release for our RGB line of peripherals and contains a multitude of changes and enhancements.

Fixes / Improvements

- Resolved an issue with RGB keyboards and detection of certain modifier and lock keys.
- Resolved an issue with Imagus (a Google Chrome extension) and CUE.
- CUE now has an option to manually disable auto-shutoff in Device Settings for VOID Wireless Headsets.
- Resolved miscellaneous bugs.
- As of CUE v1.12 and newer, VOID USB and Wireless headsets now support a graphic visualizer when used in conjunction with any Corsair RGB keyboard. You can find this option under effects and use it after enabling your headset as the default playback and recording device in the OS.

Important Note

During a firmware or software update for any Corsair peripheral, CUE may need additional components and time from a Window's Driver Software Installation to complete the process.

If you have to abort at any part of the process, simply reconnect the device and select Update Firmware from the Devices -> Settings Menu, and choose "Force Update from Server" to re-initiate the update.

Keyboard Connectivity

Connecting via USB 3.0:

Use one connector (the one with the keyboard icon) when connecting via USB 3.0

Connecting via USB 2.0:

Use both connectors when using USB 2.0.*

* Plug in the connector with the two arrows icon first, and the connector with the keyboard icon second.
